

Mosquito Forecast

For the Month of September 5-11, 2020

NUISANCE LEVEL

DISEASE THREAT

We received word that three mosquito samples collected from Chatham County were positive for West Nile virus last week. These positive samples brings our 2020 total to four from four different sites in the county, and although this may seem like a lot of activity, compared to the last three years it is not. In fact, compared to the last three years, a total of four positive pools were either met or exceeded in June alone. All four 2020 sites were aerielly treated last week and each is planned to be sprayed again this week pending weather. Overall, mosquito numbers for the month of August were slightly above July's total, but were lower than the same period in the past three years. Please call Mosquito Control if you're experiencing mosquito problems in your area. Requests for service can also be made through our website.
